

Digital management for auto repair shops

Every auto shop on one screen.

Work orders, customers, warehouse, finance and fiscal receipts — one platform, built for Uzbekistan and the wider CIS.

AI assistant

3 languages

9 plate formats

Telegram-native

THE PROBLEM

A 4.7-million-car market still runs on paper.

01

The notebook is the system

Jobs, agreed prices and customer debts live in a paper notebook or a chat thread. Nothing is searchable, nothing is auditable, nothing survives a staff change.

02

The owner flies blind

No one can answer “what did I earn this month, and on which services?” without counting cash by hand at the end of the day.

03

The customer waits in the dark

No estimate to approve, no status while the car is in the shop, no receipt afterwards. Trust is rebuilt from zero on every visit.

04

Fiscal duty is a burden

The soliq chek is issued late, filled in by hand, or quietly skipped — and the shop carries the risk.

4.73M

private vehicles registered

+415k

added in a single year

2,030

mapped repair shops

THE SOLUTION

One platform. The whole shop.

A car arrives, a job opens, the customer approves the estimate on Telegram, mechanics work it from their phones, parts leave the warehouse, a fiscal receipt is issued — and the money lands in the books by itself.

● Work orders

An 8-state job lifecycle with per-item mechanic assignment and time tracking.

● Customers & cars

Plate search, full vehicle history and a per-car service book.

● Warehouse

Products with variants, stock movements, counter sales and a shared catalogue.

● Finance

Multi-currency, customer and supplier ledgers, expenses and live P&L.

● Fiscal receipts

Uzbek chek with STIR, itemised discount, QR and OFD receipt id.

● AI assistant

15 read-only tools over your own data, in plain language.

HOW IT WORKS

The job moves itself.

Six stages, each one a state the whole shop can see. Nothing is re-typed and nothing is remembered by hand.

1 Intake

Plate typed or found in one second. Car, owner and odometer attach themselves.

2 Estimate

Services and parts pulled from the price menu; a negotiated discount is recorded, not hidden.

3 Approval

The customer approves or declines on Telegram — or via an unguessable web link. No app to install.

4 In progress

Each line item is assigned to a mechanic, who moves it on their phone. Timers record real labour.

5 Ready

The customer is notified the moment the car is ready. Parts are written off the warehouse automatically.

6 Receipt & close

Fiscal chek issued, split or credit payment recorded, revenue booked, next service reminder scheduled.

● A background scheduler then follows up on its own: service reminders when they come due, appointment reminders 24 hours ahead.

THE PRODUCT

Four front doors, one system.

Owner console

Web

Live dashboard, job board, warehouse, finance and nine report types. Everything the person who carries the risk needs to see.

Mechanic app

Phone

Only the jobs assigned to them, moved in two taps. Costs, margins and profit are never rendered on this screen.

Customer

Telegram

Approve an estimate, watch the job, get “your car is ready”, keep the service history. Nothing to install.

Admin console

Platform

Cross-shop control: the shared product catalogue, integrations, leads and platform-wide service performance.

DIFFERENTIATOR

Talk to your data.

Ask “how is profit this month?” in plain Uzbek, Russian or English. The assistant answers with real tables and clickable buttons that navigate the app to the exact screen.

How's profit this month?

Net profit: 38.6M UZS

+18% vs last month

Open finances →

Also an MCP server

The same tool registry is exposed over Model Context Protocol (JSON-RPC), so an owner can point Claude Desktop at their shop with the same bearer token they already use.

Read-only by construction

- The registry holds only List and Get tools — no create, update or delete tool exists to call.
- The shop is derived from the signed-in identity, never from what the model asks for.
- An owner is permanently pinned to their own shop; only a super-admin may read across shops.
- Replies are sanitised against a strict tag allowlist before they reach the screen.

LOCALISATION

Built for Uzbekistan, not translated into it.

Fiscal chek

Seller, STIR, cashier, itemised lines, QR and OFD receipt id.

Soum-first, multi-currency

Each shop holds its own rate, with full rate history.

Nasiya

Credit sales tracked on real customer ledgers and balances.

Company payments

Bank transfer between legal entities, with counterparty ledgers.

SMS + Telegram

PlayMobile SMS and Telegram Gateway OTP, with automatic fallback.

Three languages

O'zbekcha, Ўзбекча and Русский across the entire interface.

Nine plate formats

Uzbek plates plus eight more CIS formats, rendered authentically.

Local car catalogue

Makes and models with logos, curated centrally for every shop.

TECHNOLOGY

Engineered like infrastructure.

Contract-first protobuf, seven Go services behind one gateway, and a deployment that updates itself.

Clients

Web console · Mechanic phone · Telegram bot · Admin console

Edge

Caddy — automatic TLS

Gateway

HTTP/JSON → gRPC · 169 endpoints · auth, RBAC, CORS

Services

auth · customer · workorder · invoice · notification · reporting

Data

PostgreSQL, six isolated databases · NATS event bus

CI / CD

- CI builds one image per service and pushes to the registry on every merge.
- Watchtower pulls and restarts changed services — no manual deploy step.
- Migrations re-run safely under an advisory lock on every restart.
- Prometheus, Grafana, Loki and Promtail ship with the stack.
- Sized for the MVP on a single VPS, with a documented path to managed Postgres and HA.

PROOF

Not a prototype. A running system.

7

Go microservices

169

REST endpoints

259

automated tests

84

database migrations

65k

lines of code

9

report types

Ten repositories, a shared protobuf contract, and a single-command deployment that has been running the full stack end to end.

TRUST

Security is a design decision, not a setting.

● Tenant isolation at the boundary

Every service derives the shop from the authenticated token. Six separate databases, no cross-shop joins.

● Roles a shop defines itself

Custom roles with a per-permission matrix, rather than three fixed roles that never fit.

● Mechanics cannot see money

Cost, margin and profit are withheld from the mechanic surface by the API, not hidden by CSS.

● Unguessable public links

Invoices and approval links carry random tokens, never sequential identifiers.

● Read-only intelligence

The AI and MCP surfaces physically cannot mutate a record.

● Audited money paths

An audit log covers the operations that move money or void a receipt.

MARKET

A fleet growing faster than the shops serving it.

4.73M

private vehicles registered in Uzbekistan (Oct 2025)

+415k

vehicles added in twelve months

92.9%

of the fleet is passenger cars

The serviceable base

2,030 auto repair shops and 830 parts stores appear in commercial business directories. The real market is materially larger and largely informal — which is precisely the segment that has never had software.

Expansion is already engineered

Nine CIS plate formats, three interface languages and per-shop multi-currency are in the product today. Entering Kazakhstan, Kyrgyzstan or Tajikistan is a go-to-market exercise, not a rebuild.

TAM / SAM / SOM

To be completed with your pricing and reachable-shop assumptions.

Sources: Statistics Agency under the President of the Republic of Uzbekistan (stat.uz), Oct 2025; commercial business directory data, 2026.

BUSINESS MODEL

A subscription per shop, priced by shop size.

Start

- One location
- Up to three mechanics
- Work orders and customers
- Fiscal receipts

Business

Most popular

- Unlimited mechanics
- Telegram bot and reminders
- Finance and P&L
- AI assistant

Network

- Multiple locations
- One control panel
- Custom integrations
- Priority support

Revenue expands with the customer: more mechanics, more branches, the AI tier, and custom integrations for chains.

Fill in: price per tier · ARPU · gross margin · CAC and payback

Where we are today.

These figures come out of the product itself — it ships a lead and demo-request CRM, so the pipeline is measured, not estimated.

● Fill in before presenting — these are the only numbers a jury or an investor will test.

What the money buys.

1 Now

- Live OFD fiscalisation replacing the current stub
- Click, Payme and Uzum payment acceptance
- First cohort of paying shops onboarded

2 Next

- Native iOS and Android apps for mechanics
- Consolidated reporting across branches
- Parts supplier marketplace inside the warehouse

3 Later

- Predictive maintenance from service-book history
- Insurance and corporate fleet contracts
- Market entry across the CIS

TEAM

Who is building this.

Founder / CEO

Engineering

Commercial

Add each founder: name, role, and the one line that makes them the right person for it.

We built the system.

Now we scale it.

Ten repositories, seven services and a working product — looking for the capital and the partners to put it in every shop in the country.
